The antibody also has a complementarity determining region (CDR) that specifically binds to a metal chelate against which the wild-type antibody is raised. The complementarity determining region (CDR) that specifically binds to a metal chelate against which the wild-type antibody is raised. The cactive site of the mutant antibody is in a position proximate to or within the CDR, such that the chelate and the antibody are able to form a covalent bond. The present sequence is that of the light chain variable covalent bond. The present sequence is that of the light chain variable contation. As an example of the method of the invention, rational computer added design was used to develop an indium-EDTPA chelate to covalently computed conditions in variable of the invention and the chelate to bind noncovalently to CHA255 bound to a tumour and then to covalently attach the chelate to the antibody, thereby trapping it at the tumour site. This covalently contains the variable domains of CHA255 to construct and the synthesis and screening of benzyl-EDTA chelates carrying coli,, and the synthesis and screening of benzyl-EDTA chelates carrying veakly electrophilic groups capable of conjugation of the antibody in vivo. This Fab can be conjugated to a targeting moiety when desired, A reactive site was incorporated into the antibody by engineering a Cys residue at location Asn-96 or Ser-95 of the light chain, near the region of the antibody to which the chelate bound. This was accomplished by site carricchelate antibody anucleic acid encoding the wild-type of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       180

complementarity determining region (CDR) that specifically binds to a metal chelate against which the wild-type antibody is raised. The reactive site of the mutant antibody is in a position proximate to or within the CDR, such that the chelate and the antibody are able to form a covalent bond. The present sequence is that of the light chain of antification. The present sequence is that of the light chain of antification of antibody CHA255. As an example of the method of the invention, rational computer-aided design was used to develop an indium-EDTA chelate to covalently bind to CHA255 in vivo. The premise was to allow the chelate to bind non-covalently to CHA255 bound to a tumour and then to covalently attach the chelate to the antibody, thereby trapping it at the tumour site. This involved cloning the variable could be expressed in Escherichia coli, and the synthesis and screening of benzyl-EDTA chelates carrying weekly electrophilic groups capable of conjugation of the antibody in vivo. This Fab can be conjugated to a targeting moiety when desired. A reactive site was innorporated into the antibody by engineering a late of the antibody to which the chelate bound. This was accomplished by site-directed mitagenesis of a nucleic acid consists the conjugation of the conjugation of the antibody to which the chelate bound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The invention provides a mutant antibody comprising a reactive site that is not present in the wild-type of the antibody. The antibody also has a complementarity determining region (CDR) that specifically binds to a metal chelate against which the wild-type antibody is raised. The reactive site of the mutant antibody is in a position proximate to or within the CDR, such that the chelate and the antibody are able to form a covalent bond: The present sequence is that of the light chain variable covalent bond: The present sequence is that of the light chain variable region of anti-indium-EDTA monoclonal antibody CHA255, carrying a S95C mutation. As an example of the method of the invention, rational computer region of anti-indium-EDTA monoclonal antibody CHA255, carrying a S95C covalently to CHA255 bound to a tumour and then to covalently or CHA255 bound to a tumour and then to covalently or CHA255 bound to a tumour and then to covalently attach the covalently to CHA255 bound to a tumour and then to covalently attach the channer of the antibody, thereby trapping it at the tumour site. This involved cloning the variable domains of CHA255 to construct a covalently actorphilic groups capable of conjugation of the antibody in covic. This Fab can be conjugated to a targeting moiety when desired. A reactive site was incorporated into the antibody by engineering a Cys residue at location Abn.96 or Ser-95 of the light chain, near the region of the antibody to which the chelate bound. This was accomplished by site conficed mutagenesis of a nucleic acid encoding the wild-type of the conficed mutagenesis of a nucleic acid encoding the wild-type of the

Specifically, it refers to an antibody that comprises a metal chelate bound to an antigen recognition domain, where the metal chelate has a reactive functional group of complementary reactivity to the reactive site of the antibody. This reactive site is the side chain of a naturally occurring amino acid e.g. the -SH group side chain of a cysteine residue (not present in the wild type) which can be used to form a covalent bond between the reactive site of the antibody and the

                describes using these antibodies for in vivo imaging where the antibody comprises a targeting molety that binds specifically to a cell via a cell surface receptor or antigen thus forming a cell-autant antibody complex. On addition of the metal chelate, a cell-antibody-metal chelate complex. Is formed that can be detected using emission tomography, magnetic resonance imaging, lanthanide luminascence, gamma-emissions or single photon emission tomography (SPFT). As such, this method is useful for treating a subject with cancer and pharmaceutical compositions exhibit typestic and immunosuppressive activities. This polypeptide sequence is the chimeric murine antibody 2D12.5 variable light chain protein fused to the human anti-tetanus toxin antibody kappa light chain constant region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        120

chelating agents and metal chelates, particularly macrocyclic metal chelates. Specifically, it refers to an antibody that comprises a metal chelates. Specifically, it refers to an antibody that comprises a metal chelate bound to an antigen recognition domain, where the metal chelate che as a reactive functional group of complementary reactivity to the reactive site of the antibody. This reactive site is the side chain of a naturally occurring amino acid e.g. the -SH group side chain of a cysteine residue (not present in the wild type) which can be used to form a covalent bond between the reactive site of the antibody and the cactive functional group of the metal chelate. The present invention describes using these antibodies for in vivo imaging where the antibody complex. On addition of the metal chalate forming a cell-mutant antibody complex. On addition of the metal chelate, a cell-antibody-metal chelate complex is formed that can be detected using emission tomography, magnetic resonance imaging, lanthanide luminescence, gamma-emissions or single photon emission tomography (SPET). As such, this method is useful for treating a subject with cancer and pharmaceutical compositions exhibit cytostatic and immunosuppressive activities. This polypeptide sequence is the chimeric mutant N33C murine antibody 2D12.5 variable light chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61 VPARFSGSLIGDKAALTIAGTQTEDEAIYFCALWYSNHWVFGGGTKLTVLSRTVAAPSVF 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  121 IFPPSDEQLKSGTASVVCLLNNFYPREAKVQWKVDNALQSGNSQESVTEQDSKDSTYSLS 180

The present sequence is the protein sequence of the light chain of human CC 1gd1 antibody 025, which specifically recognises human B cell associated antigen CD72. An scrv ADR23124 selected from an antibody phage display library was shown to specifically recognise the human CD72 receptor. The scrv was recloned in IgG expression vector C01 using primars designed to scrv was recloned in IgG expression vector C01 using primars designed to scrv was recloned in IgG expression vector C01 using primars designed to scrv restore complete human frameworks, thereby generating antibody 025. Such anti-CD72 immunosolobulins or their antigen-binding fragments can be used as internalising human binding molecules are capable of (specifically) binding to CD72 or its antigenic determinant, and preferably bind to CD72 casque with cells. Upon binding to CD72 present on the surface of target cells, the binding molecules internalise. In addition to the internalising human binding molecules, the invention provides of target cells, the binding molecules, the invention provides of carget cells, the binding molecules, the invention provides of the internalising human binding molecules, immunoconjugates, nucleic acids encoding these, and compositions comprising them. The internalising human binding molecule, immunoconjugates, nucleic acids encoding these, and compositions comprising them. The molecule or composition can be used in the diagnosis and/or treatment of molecule and B cell associated disorder or disease, especially a B cell associated autoimmune disorder (claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                            New internalizing human binding molecules capable of specifically binding to CD72, useful for diagnosing and/or treating B-cell associated diseases, such as cancer or autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       FIFPPSDEQLKSGTASVVCLLNNFYPREAKVQWKVDNALQSGNSQESVTEQDSKDSTYSL 179

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence is used in a method for obtaining a novel gene construct (A) which expresses, in cells of a mammal, a conjugate (B) of a cell-targeting group (I) and a heterologous prodrug-converting enzyme (II), and (B) is directed to leave the cell for selective localisation at a cell surface antigen (Ag) recognised by (I). Delivery of (A) to a target site, then administration of (III) is used for targeted release of cytocoxic drug, specifically for treating cancer but also inflammation such as rheumatoid arthritis. In situ generation of the targeting antibody increases selectivity, reducing side effects at normal tissue. The method is applicable to any antibody-directed enzyme prodrug therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New gene construct expressing conjugate of targetting agent and prodrug-converting enzyme - useful for, e.g. targetted production of cytotoxic drug in vivo, especially for treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   80
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PPSDEQLKSGTASVVCLLNNFYPREAKVQWKVDNALQSGNSQESVTEQDSKDSTYSLSST

The present invention relates to domain deleted CC49 or C2B8 antibodies. Domain deleted CC49 antibodies comprise a heavy chain human CC49 domain deleted sequence in which CH2 domain has been deleted and are reactive with tumour associated antigen (TAG)-72. The C2B8 antibodies are reactive with CD20 and comprise a heavy chain having a sequence of a derived domain deleted C2B8 construct where the CH2 domain has been deleted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               135
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel domain deleted CC49 antibody reactive with tumor associated antigen -72, or C2B8 antibody reactive with CD20, useful for treating myelosuppressed patient suffering from a neoplastic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            118
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       136 VFIFPPSDEQLKSGTASVVCLLNNFYPREAKVQWKVDNALQSGNSQESVTEQDSKDSTYS 195
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   58
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      94
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequences of the invention are useful for imaging a neoplasm. They are also useful for treating myelosuppressed patients suffering from neoplastic disorder such as haematologic neoplasm, preferably non-Hodgkin's lymphoma. Autibodies of the invention are also used to treat neoplastic disorder, colon cancer and haematologic malignancy. They are useful for reducing tummour size, inhibiting tummour growth and/or prolonging the survival time of tumour-baring animals and for treating tummours. The present sequence is human C2B8 light chain protein. This sequence is used in the exemplification of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cytostatic; antiinflammatory; cardiovascular; gene therapy; antibody; Fc; agriculture; industrial application.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an antibody comprising an Fc variant portion having an amino acid modification in the Fc region of the parent Fc polypeptide, where the Fc variant modulates binding to an Fc-gamma-R compared to the parent Fc polypeptide. The antibody may also be used in research and in agricultural or industrial applications. This sequence corresponds to the light chain of the antibody "Rituximab" as an example of an antibody of the invention.

                                                                                          g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a dimeric antibody (I) comprising several moromeric subunits, where the monomeric subunits are non-covalently associated. (I) is useful for treating a disorder, especially immune disorder, and neoplastic disorder such as relapsed Hodgkin's disease, resistant Hodgkin's disease high grade, low grade and intermediate grade non-Hodgkin's lymphomas, B cell chronic lymphocytic leukemia B-CLL), lymphoplasmacytoid lymphoma (LPL), mantle cell lymphoma (MCL), diffuse large cell chronic cell lymphoma (MCL), diffuse large cell lymphoma (DLCL), Burkitt's lymphoma, AIDS-related lymphoma, manorytic B cell lymphoma, angloimmunoblastic lymphoma, and loiaved cell, large cell immunoblastic lymphoblastoma, small, non-cleaved burkitt's and non-Burkitt's, follicular, mixed small cleaved and large cell lymphomas, in a mammal (see ABZ24017 for a detailed description of the various uses of (I)). The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PGVPARFSGSLIGDKAALTITGAQTEDEARYFCALWYSCLWVFGGGTKLTVLSRTVAAPS 118
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel dimeric antibody useful for treating immune disorder and neoplastic disorder, has several non-covalently associated monomeric subunits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       28

The Fab can be obtd. by papain digestion of the MAD or by recombinant methods utilising cDNA clones (AAAT41873-74) coding for the light and heavy chains. 5D5 Fab is an antagonist of the HGF receptor and is useful for the diagnosis and

The present sequence represents a dimeric anti-CD20 light chain

CC polypeptide. The dimeric immunoglobulin is used in the method of the
polypeptide. The dimeric immunoglobulin is used in the method of the

CC immunoglobulin (Ig) G/IgG dimer. The method comprises genetically
cengineering a monoclonal antibody to introduce a cysteine molecule which

CC endineer that is capable of activating components of the complement

CC heavy chains on the same antibody molecule. The dimer is a homodimer or

CC heavy chains on the ability to activate and kill cells via the complement

CC cascade. The dimer is also capable of binding to Fegamma receptors on

CYCLOXIC effector cells and on host immune cells, and is capable of

initiating programmed cell death. The IgG/IgG dimers may be used to treat

CC anterdic disorders, cancers and autoimmune diseases such as allergic

atopic dermatitis, Crohn's disease, Graves's disease, food allergies,

CC allergic contact dermatitis, CLL cancers and/or B-cell lymphomas. They

may also be used to treat a range of other diseases and disorders such as

crhemmatoid arthritis, ulcerative colitis, psoriasis, pigeon breeder's

disease, hepatitis, leprosy, Lyme disease, diabetes mellitus, candidiasis
                                                               Anti-CD20 antibody; dimeric immunoglobulin; immunoglobulin; IgG; complement system; Fcgamma receptor; cytotoxic effector cell; host immune cell; altestic disorder; cancer; autoimmune disease; allergic asthma; altopic dermatitis; Crohn's disease; allergic asthma; atopic dermatitis; Crohn's disease; allergic bronchopulmonary aspergillosis; allergic rhinitis; Graves's disease; food allergy; allergic contact dermatitis; cancer; B-cell lymphoma; rheumatoid arthritis; ulcerative colitis; psoriasis; pigeon breeder's disease; hepatitis; leprosy; Lyme disease; disease; aplastic anaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Genetically engineering immunoglobulin (Ig) G/IgG dimers for the treatment of cancers, allergic disorders and autoimmune conditions.

The invention relates to an isolated human monoclonal rables virus neutralising antibody (virucide) derived from cDNA clones encoding the antibody heavy and light chains expressed in heterologous expression systems and purified away from deleterious contaminants. The invention provides a fused gene encoding a chimeric immunoglobulin light chain and a fused gene encoding a chimeric immunoglobulin heavy chain. The antibody of the invention is useful for
                                                                                                                                                                                                                                                                                     119 VPIFPPSDEQLKSGTASVVCLLANPYPREAKVQWKVDNALQSGNSQESVTEQDSKDSTYS

S
individual a therapeutically effective amount of the antibody, and preventing a spread of the rabies virus to the central nervous system (CNS). The antibody of the invention provides a safe and efficacious post-exposure prophylactic therapy for individuals exposed to a rabies virus
                                                                                                                                                                                                                        122
                                                                                                                                                                                                                                                                                   182
                                                                                                                                                                                                                                                                                                       The invention discloses a recombinant antibody comprising a constant region of monoclonal antibody (Mab) 57 linked to a non-Mab 57 variable region. Rabies is an acute, neurological disease caused by infection of the central nervous system with the rabies virus, a member of the Lyssavirus genus of the family Rhabdoviridae. Also disclosed are methods for producing an isolated recombinant antibody by culturing a host cell, containing a recombinant expression vector comprising the nucleic acid
                                                                                                                                                                62

'n
molecule encoding the antibody, and isolating the recombinant antibody expressed and treating an individual exposed to a pathogen by administering to the individual the recombinant antibody. The recombinant antibodies are useful for preventing (vaccine) and treating an individual exposed to a pathogen, e.g. rabies infection. They are also useful for the qualitative and quantitative determination of the rabies virus. The sequences presented are the antibody protein fragments, the nucleic acids encoding them or the PCR primers used to construct the recombinant

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to the isolation of immunoglobulin (Ig) heavy and light chains of human monoclonal rabies virus neutralising antibody, and the polynucleotide sequences encoding them. The antibody specifically binds to a rabies virus protein. Also disclosed is a fused gene encoding a chimeric immunoglobulin light or heavy chain comprising first DNA sequence encoding an immunoglobulin light or heavy chain variable region of a monoclonal rabies virus neutralising antibody produced by a heterohybridoma cell line and a second DNA sequence encoding a recombinant antibody. The polynucleotide sequences, antibodies and methods are useful for diagnosing, preventing or treating an infection of pathogens that target neuronal tissues, particularly realism.

Sequence 12, Application US/08397411

Sequence 12, Application US/08397411

Sequence 10. 6129914

GENERAL INFORMATION:

APPLICANT: Gingrich, Roger

APPLICANT: Link, Brian

TITLE OF INVENTION: Bispecific Antibody Effective to Treat

TITLE OF INVENTION: B-6-11 Lymphoma and Cell Line

NUMBER OF SEQUENCES: 14

CORRESPONDENCE ADDRESS:

ADDRESSEE: Townsend and Townsend and Crew

STREET: One Market Plaza, Steuart Tower, Suite 2000

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
